

Introducing the 4000 Series Sensors

The new sensors builds upon the styling and features of the existing line of sensors give you the same form, fit, and function. The upgrade to the 4000 series sensor updates the technology for programming your device via an iOS and Android app rather than the WIR-3110, giving you the tools to configure your switches and sensors at your fingertips. The sensors new features add a two stage timer called prolong, allowing you to dim the lights first before turning off. This feature also enables the sensors to be compliant with the >600sqft open area requirements in Title 24 2022, effective this year.

The wall switch sensor improves the useability of the dimming feature by providing a raise and lower button to dim lights controlled on the dataline.
